An AMG method which is based on CR method was proposed by Shapira to be commonly used in the numerical solution of partial differential equations [8,9]. The term matrix dependent multigrid refers to a class of multigrid algorithms for the quick exponentiation in block upper triangular matrices of  $2 \times 2 \times 2$  blocks.

An introduction to multigrid methods. Introduction This study considers the numerical solution of the large scale linear algebraic system arising from the discretization of the partial differential equations.

The mixed finite element discretization of the weak formulation of the Stokes problem. The numerical treatment is given to the discrete Stokes problem which resulted from the mixed finite Hood-Taylor stable elements consisting of biquadratic elements for the velocities and bilinear elements for the pressure, on a uniform grid.
